

Identification of Terrestrial planets in the habitable zone of nearby solar-type stars

Panel: A. Léger, M. Shao, D. Queloz, W. Traub

Chair: C. Eiroa

- Real NEAT discovery space?

- RV
- Transits
- Is NEAT unique (and in which sense) for the FGK stars at $d \leq 15$ pc?

-What does NEAT add?

-Need of clarification for non-expert readers of (NEAT paper):

“Special emphasis will be put on planets in the Habitable Zone because this is a region of prime interest for astrobiology. ***Indeed orbital parameters obtained with NEAT will allow spectroscopic follow-up observations to be scheduled precisely when the configurations is the most favorable***”.
